Sensory Processing Difficulties (SPD) include sensitivities to certain sensations e.g. noises, smells, the taste of particular foods, the feel of different clothes or another person's touch, & these experiences can interfere with our ability to engage in typical daily activities.

Those with SPD may also avoid or seek these sensations through certain behaviours & they may appear uncoordinated.

Sensory processing can be very variable from one day to another & from one child to another.

Do you recognise these behaviours in your child or a child you support at school? If so, we are interested in hearing your experiences!
